PROFESSIONAL SUMMARY

Software engineer building AI, backend, and full-stack systems in Python and TypeScript. First Class Computer Science graduate (GPA 4.57/5.00) who has designed and shipped end-to-end applications including an LLM observability platform and a retrieval-augmented document question-answering API, combining FastAPI services, PostgreSQL persistence, and LLM integrations.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Bash
AI / ML: Claude API, OpenAI, LiteLLM, RAG, pgvector, LLM Evaluation & Observability, scikit-learn, pandas
Backend & Data: FastAPI, Node.js, RESTful APIs, SQLAlchemy, PostgreSQL (Neon), Redis, Celery
Frontend: React, Next.js, TanStack, HTML5, CSS3
DevOps & Tools: Docker, GitHub Actions, CI/CD, Git, Linux, pytest, Streamlit

EXPERIENCE

AfterQuery — *Software Engineer (promoted from Mid-Level Full-Stack Engineer)* Remote · Aug 2026 – Present

- Build and ship full-stack product features across React and TypeScript interfaces and Python backend services, working from API design through to deployment.
- Contribute to code review, automated testing, and iterative delivery within a distributed engineering team.

Anazemma Global Enterprises Nigeria Limited — *Software Engineer* Abuja, Nigeria · Apr 2026 – Present

- Maintain the company's office server, website, and broader IT infrastructure, and support data collection, cleaning, and analysis workflows for the business.

National Information Technology Development Agency (NITDA) — *IT Intern* Abuja, Nigeria · Mar 2024 – Sep 2024

- Wrote Python scripts to organize, sort, and filter operational data, increasing data management efficiency by 25% and team data accessibility by 30%.
- Collaborated with the IT team to streamline workflows and reduce redundant data handling by 20%, alongside public digital literacy initiatives.

PROJECTS

LLM Evaluation & Observability Platform — *Python, FastAPI, PostgreSQL (Neon), SQLAlchemy, Streamlit* Jul 2026 – Present

- Built an observability service that traces every LLM call, covering prompt, response, tokens, latency, and cost, through a FastAPI ingestion API backed by PostgreSQL.
- Created a Python SDK that wraps LLM calls to report traces automatically, plus a Streamlit dashboard charting cost, latency, and error trends over time.

Document Intelligence API — *Python, FastAPI, PostgreSQL, pgvector, Docker, Claude API, OpenAI Embeddings* Jul 2026 – Present

- Built a document question-answering REST API with FastAPI that ingests PDFs, chunks and embeds them, and answers questions with structured citations from the Claude API.
- Implemented hybrid retrieval fusing PostgreSQL full-text search with pgvector embeddings via Reciprocal Rank Fusion, with cost and latency telemetry on every query.

Heart Disease Risk Prediction — *Python, scikit-learn, pandas, Streamlit* Final Year Project · 2024 – 2025

- Trained and compared machine-learning models on the Framingham Heart Study dataset (4,240 patients) to predict 10-year coronary heart disease risk, handling class imbalance with SMOTE and evaluating with ROC-AUC.
- Built a leakage-free scikit-learn pipeline and a Streamlit web app that turns a patient's health details into a risk percentage.

Additional Projects Jul 2026 – Present

- Transformer From Scratch (PyTorch) — GPT-style language model with causal self-attention. RelayQ (Python, Redis) — Celery-like task queue with retries, backoff, priorities, and dead-letter queues.

EDUCATION & CERTIFICATIONS

B.Sc. Computer Science — Landmark University, Nigeria Graduated August 2025

First Class Honours | GPA: 4.57/5.00 | Concentrations: Artificial Intelligence, Python Programming

Relevant Coursework: Data Structures & Algorithms, Database Design & Management, Machine Learning, Artificial Intelligence, Object-Oriented Programming

- Supervised Machine Learning: Regression and Classification — DeepLearning.AI & Stanford (Coursera, Jan 2026)
- Python for Data Science, AI & Development — IBM (Coursera, Jun 2026)
